Research Interests

The Jiao group primarily focuses on developing electrochemical devices for solving critical issues in energy storage and sustainable chemical production. Currently, the group is working on two research directions: (1) Electrochemical systems for carbon utilization. Electrochemical reactors and processes that can convert carbon dioxide and carbon monoxide into value-added chemicals are being engineered to achieve orders of magnitude higher current densities than conventional batch systems. (2) Nanostructured materials for energy applications. Novel synthetic methods enable us to prepare nanostructured materials with morphologies and compositions that cannot be accessed using existing approaches. We are actively exploring new nanomaterials as potential electrocatalysts and electrode materials for energy storage and conversion applications. Breakthrough in these directions may help us address global climate changes by providing clean, sustainable, and environmentally friendly fuel and chemical supplies.
